Angell's Psychology

By JAMES ROWLAND ANGELL

Head of the Department of Psychology in the University of Chicago

396 pages, 12mo, $1.50 net

This book sets forth in an elementary way the generally accepted facts and principles bearing upon the fields of psychological inquiry. It is written in the belief that psychology has now reached a point where students may advantageously be given a more distinctly functional and genetic account of mental processes than has hitherto been feasible. It is hoped that students of philosophy, as well as students of education, may find the book especially useful.

JOHN E. RUSSELL, Professor in Williams College:

"I am disposed to regard this book as the most successful and satisfactory work of its class I have examined. I know of no similar book that has so successfully brought the results of modern physiological and experimental methods in psychology to bear upon the problems of mind. I know of no book better adapted to give the young student a clear comprehension of all the important facts relating to the structure and development of the human mind."

DR. ROBERT M. YERKES, Harvard University:

"All I wish to say of the work at present is that it satisfies my requirements for an elementary text-book in psychology better than any other work in English."

LEWIS C. CARSON, Professor in Indiana University:

"It seems to me to possess features of excellence that make it in many respects superior to any other book now in use for the purposes of an introductory course."

C. E. SEASHORE, Professor in the State University of Iowa:

"I have examined it carefully and am highly pleased with it as a text book. I have given orders at the bookstores to have it on hand for my elementary classes next week."

HENRY A. RUGER, Professor in Colorado College:

"Seems to me to be the best elementary psychology with which I am acquainted. The treatment of the nervous system is up-to-date and presents, as it seems to me, the things which a student of psychology most needs to know. The biological and functional point of view is kept constantly to the fore, and the different mental processes and attitudes are brought out in strong relief. The style and the thought are clear, and here is perhaps the chief excellence of the book, as it would be its chief requirement. The larger problems are hinted at in a suggestive, but not confusing way."

WILL S. MONROE, State Normal School, Westfield, Mass.:

"I am familiar with no text which seems to me to meet so excellently the needs of the elementary student of psychology. The book ought to have large use in colleges and normal schools."

E. A. KIRKPATRICK, State Normal School, Fitchburg, Mass.:

"I have gone over a considerable part of it and find it scientific, clear and up-to-date. It is one of the best, if not the best, brief texts on psychology that have been published."

DR. IRVING KING, Pratt Institute, Brooklyn, N. Y.:

"I am confident that it is the best introductory work on really modern psychology extant. It is spicy and interesting in style, yet sacrifices nothing to accuracy of presentation. Next year I hope to introduce it into all the classes in Pratt Institute."
